Disclosed herein is a toothbrush with tapered bristles manufacturing such toothbrushes. method of toothbrush is characterized in that the tapered end of each bristle is 0.02mm or less of diameter. The bristle is tapered starting at a position of 3.5mm or less from an end, and is terephthalate made of polyethylene or polybutylene terephthalate. The method of this invention consists of the steps of dipping 3.5mm portions from ends of monofilaments for toothbrushes into erosive chemicals such as sulfuric acid sodium hydroxide until the dipped portions the monofilaments are completely eroded, neutralizing the shortened monofilaments prior to rinsing and drying them, and implanting the shortened monofilaments on а toothbrush. Thereafter, the shortened monofilaments are ground using a 240# mesh paper at 2600 to 2700rpm for 3 to 10sec, a 320# mesh paper at same speed for 3 to 10sec, and a 400# mesh paper at same speed for 3 to 10sec. The toothbrush of this flexibility and advantages of proper invention enjoys improved feeling while brushing, and excellent softness, scaling ability.
